

Project Design Phase
Proposed Solution

Date	28 September 2026
Team ID	SWTID-2026-3622
Project Name	Import Data Using Transform Maps
Maximum Marks	2 Marks

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Organisations face data errors, manual overhead, and duplicate entries when bulk importing employee records from spreadsheets into ServiceNow without proper automated mapping and unique field checks.
2.	Idea / Solution description	An automated data ingestion and analytics pipeline using ServiceNow Import Sets and Transform Maps. By setting Coalesce = True on Employee ID, incoming records are matched so existing entries are updated while new entries are inserted without duplicates. The process concludes with three visual reports integrated into a unified Employee Analytics Dashboard.

3.	Novelty / Uniqueness	Combines automated data transformation with built-in duplicate prevention via Coalesce logic, paired with backend ACL configuration (Admin Overrides) to seamlessly build real-time visual analytics dashboards.
4.	Social Impact / Customer Satisfaction	Eliminates tedious manual data entry for HR and IT teams, drastically reducing data entry errors and delivering immediate visual clarity on workforce demographics and distribution.
5.	Business Model (Revenue Model)	Internal Enterprise Solution / Platform Efficiency Model: Reduces operational labor costs, saves working hours, and prevents costly data cleanup projects in ServiceNow ITSM and HRSD environments.
6.	Scalability of the Solution	Highly scalable across any enterprise department or dataset (e.g., Asset Management, User Rosters, Vendor Lists) by simply creating target table mappings and applying unique coalesce keys.
